

Kerabit Ridge Vent 0,58 m

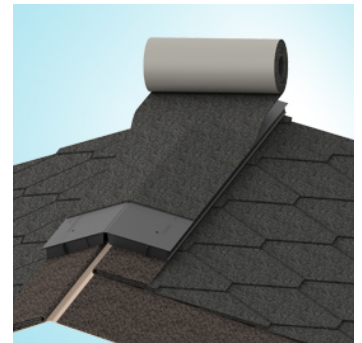

Päivitetty 25.6.2024 Tulostettu 13.7.2025

A ridge vent improves ventilation of the roof structure. It is suitable for small houses with bitumen roofs with an inclination of 1:1 to 1:5.

The ridge vents ventilate the roof structure while keeping water and snow outside. Fresh air comes in through the eaves. It is very important to ensure that the ventilation works well, because it prevents the formation of condensation water, which also prevents the growth of mould or microbes in the roof structures.

The ridge vent is black in colour. The vents are installed on the ridge one after another using snap joints. It is recommended that you install a Kerabit Ridge Vent Strip (320 mm) in the roof colour on top of them.

Please note that the ridge vent has changed in the summer of 2016. The dimensions of the previous model were different (length: 1.22 m, width on top: 290 mm).

Ridge Vent measurements:

- length 0,58 m
- width 320 mm
- height 30 mm

Package size: 12 pcs/package.

Technical data

Manufacturer / Manufactured for	Nordic Waterproofing Oy
Country of origin	Finland
Production material	polypropylene
Colours	black
Packages / pallet	12 boxes/pallet
Weight / package	9,1 kg/box
